

SMART INDIA HACKATHON 2025

Problem Statement ID	SIH25045
Problem Statement Title	Blockchain-Based Supply Chain Transparency for Agricultural Produce
Theme	Agriculture, Food-Tech & Rural Development
PS Category	Software
Team ID	89086
Team Name	Entropi

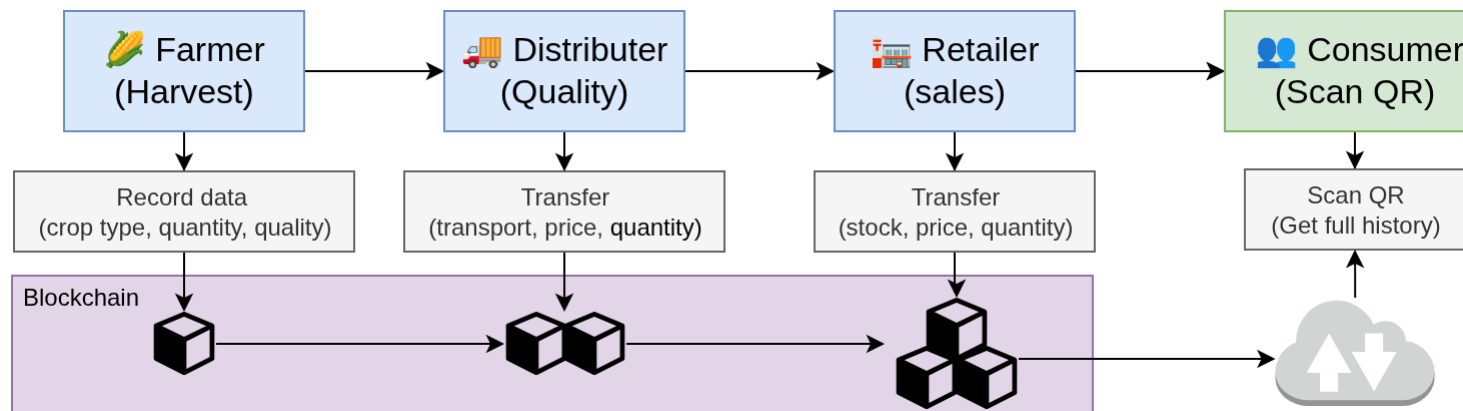

Problem

- Lack of transparency and traceability in agricultural supply chain.
- This causes cheating, unfair prices, and no way to check where food comes from or how good it is.

Proposed Solution

- A blockchain system with smart contracts, server, and website (mobile app coming soon).
- Stakeholders (farmers, distributors, retailers, inspectors) registered on-chain.
- Each harvest batch is recorded with:
 - Basic info + Hash (extra details)
 - Quality report hash
- Ownership transfers are tracked on-chain (similar to tokens on blockchain)
- Quality inspectors can attach reports to enhance trust.
- QR code provide complete batch history for consumer.

Frontend

Next.js

Expo (mobile)

Backend

eX

Express.js

PostgreSQL

Blockchain

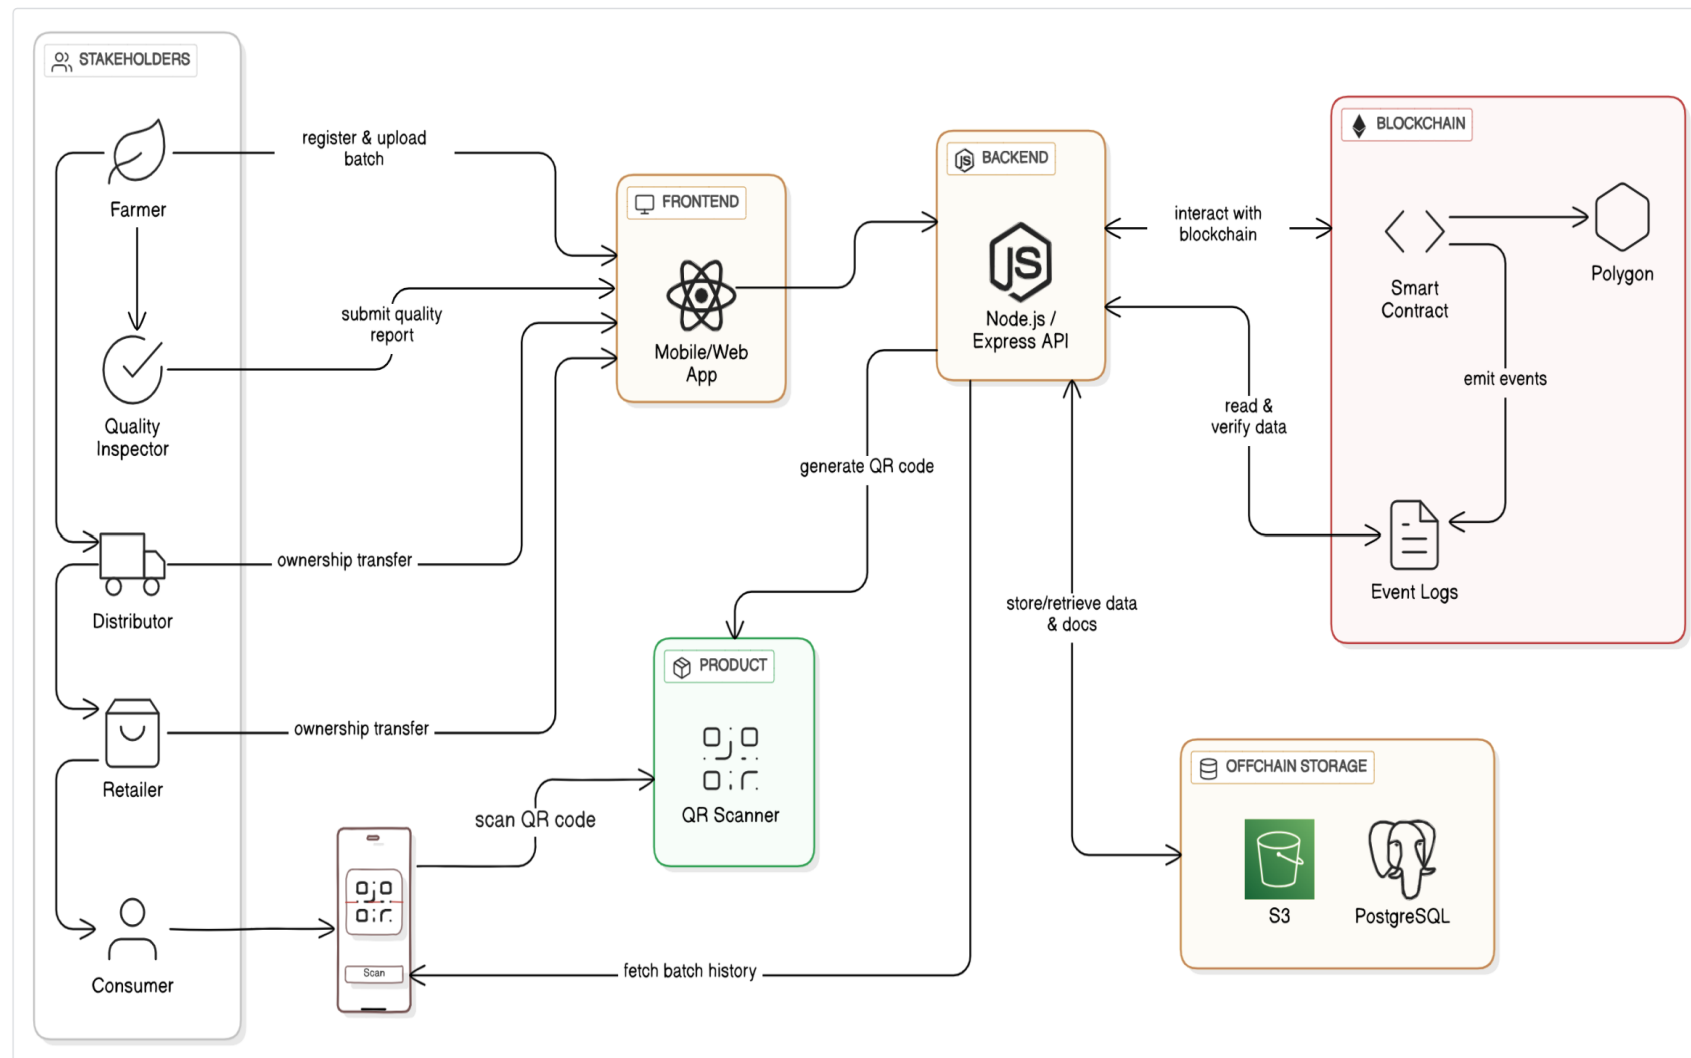

Polygon

Solidity

Why Polygon?

- Faster Transaction
- Lower gas fee
- Ethereum Compatible

✓ Feasibility Assessment

Leveraging proven systems like Ethereum and Polygon for reliable product tracking.

Smart verification through AI analysis, storing only essential data on-chain.

QR codes provide familiar, intuitive interaction patterns consumers trust.

Clear value proposition for farmers, retailers, consumers, and government.

⚠ Possible Problems

Resistance to new technology

Handling many transactions

Data Accuracy

Working with existing systems

✓ How We'll Solve These Problems

Create simple apps in local languages and offer rewards for early users

Use Polygon (a faster, cheaper blockchain system) to handle more users

Use independent inspectors and AI tools to verify photos and documents

Design flexible API connection points to link with existing business and government systems

Social

- Creates trust among farmers, distributors, and consumers through clear, secure records.
- Helps consumers feel safe about food quality by showing batch history through QR codes.

Economic

- Ensures farmers get fair prices, helping them earn steady income.
- Reduces cheating and fake products, making trade more efficient.
- Helps quality products stand out in the market with proof of where they came from.

Environmental

- Allows quick tracking of bad products, reducing food waste.
- Promotes better farming practices since everything is visible to the public.
- Helps government check if rules are being followed through unchangeable records.

Now my onions are more famous than me - thanks to blockchain

Farmers

Access to real-time prices and demand, eliminating exploitation.

Consumers

Traceability of food origin, quality, and price history via QR codes.

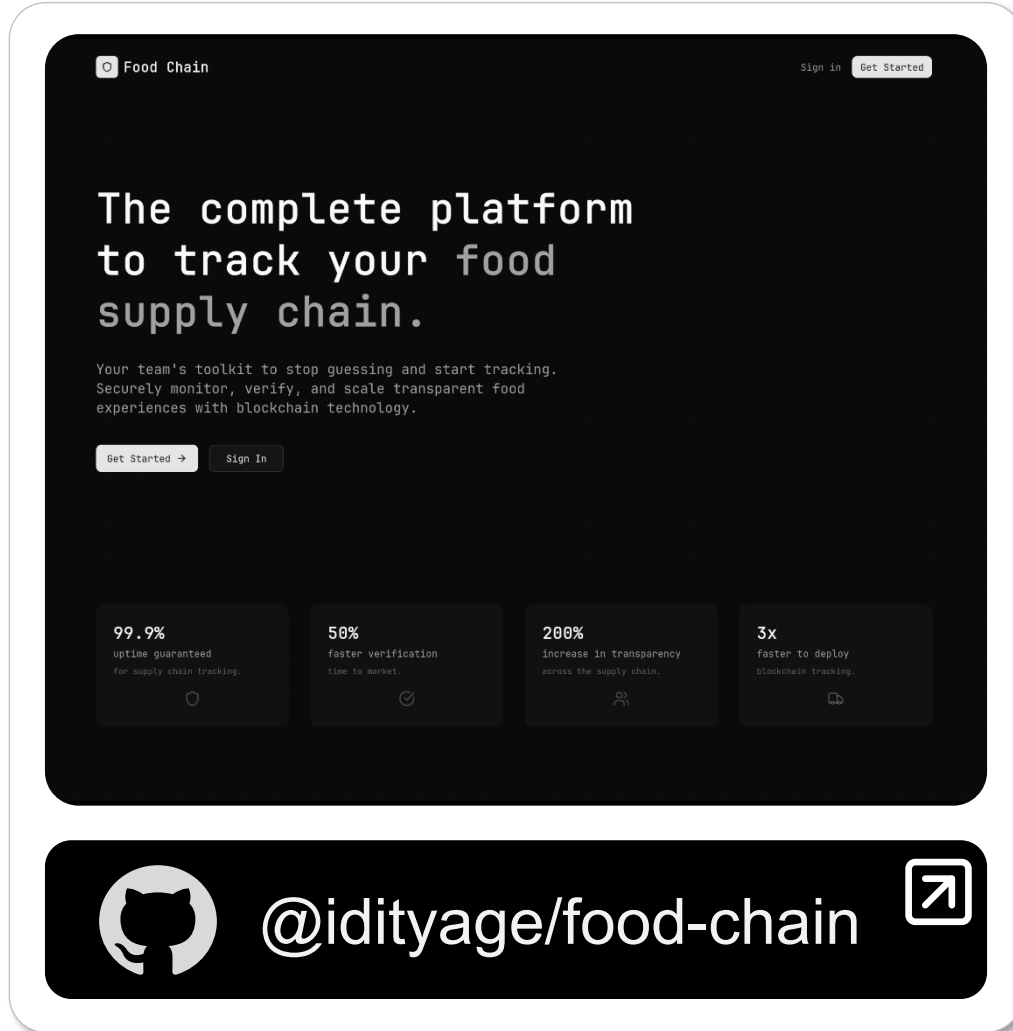

Distributors/ Retailers

Ability to prove product authenticity and quality to customers.

Government

Reliable transaction records for informed decisions and fraud detection.

Food Chain Sign In Get Started

The complete platform to track your food supply chain.

Your team's toolkit to stop guessing and start tracking. Securely monitor, verify, and scale transparent food experiences with blockchain technology.

Get Started → Sign In

99.9% uptime guaranteed for supply chain tracking.	50% faster verification time to market.	200% increase in transparency across the supply chain.	3x faster to deploy blockchain tracking.
